

Why choose an ESU Scoreboard ?

ESU has been supplying and installing scoreboards since the 1980's with scores of installations and satisfied customers both in the UK and abroad. We have always used the best available materials and technology in our products to supply a reliable and rugged solution, indeed some of those early scoreboards are still in use today.

Our traditional cricket scoreboards with wooden fascias offer an aesthetically pleasing finish with superior security. We do not surface mount the equipment on a plywood sheet, instead our fascia includes impact resistant glazed apertures behind which the displays are mounted. This gives both protection and an anti glare finish. Instead of a hinged panel we offer a clear glazed scorer's window which can be removed when required.

Fascias are finished in black acrylic or sadolin to protect them and the signboards are removable so there is no need to reletter when the fascia is repainted. We are also happy to design the fascia and provide detailed drawings for the club's own carpenters to fit, saving you money which could be better spent.

If you opt for a complete scoreboard in a box, it will be delivered to site ready to power up and use. Our scoreboards are housed in durable aluminium enclosures and the entire front face is made of polycarbonate with the displays mounted behind so there are no vulnerable protrusions. Polycarbonate is a highly vandal resistant material (they make riot shields from it) so extra protection is not required.

Total Cricket Scorer

All consoles are now enabled to operate the scoreboard from TCS.

The ESU radio remote console is truly portable. With its range of up to 250m and rechargeable batteries you can use it anywhere on the ground. It is simple to operate and lightweight making it probably the most user friendly available. Because we designed it we are also able to customise it should you have special requirements.

Why choose an ESU Scoreboard ?

CHOICE

ESU offers you a greater choice of display technology. The scoreboard can use electromechanical digits, or LED displays in seven segment or dot matrix format, and in a choice of colours to produce the optimum solution for you.

LED

LED digits have the bars or dots composed of a number of discrete light emitting diodes. Each produces a point source and they combine to form an illuminated segment. LEDs emit light in radiating beam such that the maximum intensity is seen head on to the display, diminishing as you move off axis to the left and right and also up and down. Our digits use special elliptical beam pattern LEDs to maximise the horizontal viewing angle.

ESU's digits have up to 50% more LEDs than others making them highly visible even in bright sunlight. We can also offer super bright white LEDs as an alternative to the standard amber, giving a more traditional colour scheme and making your scoreboard stand out.

ELECTROMECHANICAL

Electromechanical digits have retracting segments made of a high-visibility white or yellow reflective material. This means you can't see them without illumination, but they are easily seen in average daylight and not lost in bright sunshine. They need no regular maintenance provided they are installed in a suitable environment which keeps them dry and free from dirt and dust.

Electromechanical digits are also a green choice as they require power only whilst changing. This makes them inherently suitable for battery use when no mains power is available and even solar power can be utilised. These digits are sometimes preferred by planners in heritage sites and conversion projects as they give the scoreboard a more traditional look.

REVENUE FOR YOUR CLUB

An ESU scoreboard can actually help you raise money for your club. Our mimic plus system gives you the benefit of an LCD screen scoreboard repeater in the clubhouse which doubles as an information board and advertising display. We supply and operate these on a revenue sharing basis with the club giving you the opportunity to earn money. **Who else can offer you all this ???**
